

Client Feedback QA Report — Carsales

Purpose

This report validates the implemented dealer-inventory and buyer-marketplace changes against the six Arabic client-feedback videos. The feedback transcription and requested-changes document was used as the ground truth. Browser smoke testing was performed against the local application with temporary seeded accounts, and the temporary QA data was removed after testing.

Overall status

UI feedback coverage: PASS

Buyer read-path compatibility: PASS with legacy fallback

Database lifecycle integration: BLOCKED until the remote Supabase migration is applied

Release gates: PASS — production build, security contract tests, and lint completed with 0 errors

Ground-truth feedback coverage

1. Search, ordering, and brand recognition

Source clips: WhatsApp Video 2026-08-01 at 10.46.28 PM.mp4 and WhatsApp Video 2026-08-01 at 10.46.29 PM (1).mp4

The client asked for searchable vehicle/brand selection, consistent ordering, and recognizable brand logos or marks.

2. Agency/dealer pricing clarity

Source clip: WhatsApp Video 2026-08-01 at 10.46.29 PM.mp4

The client asked for a clearly labelled agency/dealer price and questioned the value of a separate optional auction-price field.

3. Custom trim/category and color support

Source clip: WhatsApp Video 2026-08-01 at 10.46.30 PM (1).mp4

The client asked for manual trim/category entry and manual support for custom or combined colors.

4. Saudi-market trim naming

Source clip: WhatsApp Video 2026-08-01 at 10.46.30 PM.mp4

The client asked for consistent Saudi-market terminology: Standard, Half Full, and Full, with Arabic and English shown together.

5. Color selection behavior

Source clip: WhatsApp Video 2026-08-01 at 10.46.30 PM.mp4

The client asked for common-color choices and support for a combined color. The implemented interpretation keeps one color per listing, supports custom/two-tone text, and explains that different quantities by color require separate listings.

6. Inventory editing and removal

Source clip: WhatsApp Video 2026-08-01 at 10.46.31 PM.mp4

The client asked for clear edit/add-detail/remove behavior. The implementation uses recoverable archive/hide rather than destructive deletion.

Implemented changes and QA evidence

1. Searchable makes and models — PASS

Implemented:

- Replaced the old dropdowns with searchable comboboxes using Arabic name, English name, origin, and catalog slug.
- Arabic display name is primary; English name and origin are secondary metadata.
- Makes are sorted with ar-SA collation and English tie-breaker.
- Priority makes use local assets under public/vehicle-makes; initials are used as a fallback.

QA evidence:

- English search for Toyota returned “تويوتا Toyota · اليابان”.
- Arabic search for تويوتا returned the same make.
- The picker displayed recognizable logo/initial treatment.
- No runtime third-party logo URL is required.

2. Agency price and auction-price cleanup — PASS for UI; persistence blocked by remote schema

Implemented:

- Renamed the form value to agencyPrice and mapped it to dealer_inventory.agency_price.
- Added Arabic helper text: “هذا هو سعر الوكالة الرسمي أو المرجعي، وليس عرض المشتري أو سعر المزاد”.
- Removed the optional auction-price control and stopped writing price_slots.
- Added positive-price validation in the shared create/edit schema.

QA evidence:

- The add form displayed the agency-price helper.
- The auction-price control was absent; only the explanatory helper mentioned auction pricing.
- The edit form preloaded the legacy price as 120,000 SAR through the compatibility fallback.
- The migration and RPC contract tests confirm the new field and no-price_slots write path.

Screenshot: Preloaded edit form and inventory card.

3. Custom trim, color, and two-tone entry — PASS

Implemented:

- Trim selection includes “Other — enter manually”.
- Common colors are searchable presets.
- “Custom / two-tone color” switches to a bounded manual input.
- Whitespace and separators are normalized before saving.
- The form explains that different color quantities require separate listings.

QA evidence:

- Custom trim switched to the manual textbox placeholder “اكتب الفئة”.
- Custom color switched to a manual field and accepted “White / Black”.
- The one-color-per-listing guidance was visible in the form.

Screenshot: Custom trim and two-tone color.

5 / 0

- Legacy variant values remain readable when editing existing records.

QA evidence:

- The add form showed the new Arabic/English labels.
- The edit form retained a legacy value as a readable legacy option instead of losing the existing data.

Screenshot: Saudi trim options.

5. Dealer inventory editing, visibility, and archive UX — PARTIAL / BLOCKED for mutation completion

Implemented:

- Edit route is keyed by inventory ID.
- Dealer-scoped loading prevents exposure of another dealer's listing.
- Inventory cards expose View, Edit, and Remove.
- Remove opens a recoverable hide/archive confirmation.
- Current and Archived inventory tabs are present.
- Arabic success/error handling is wired for lifecycle actions.

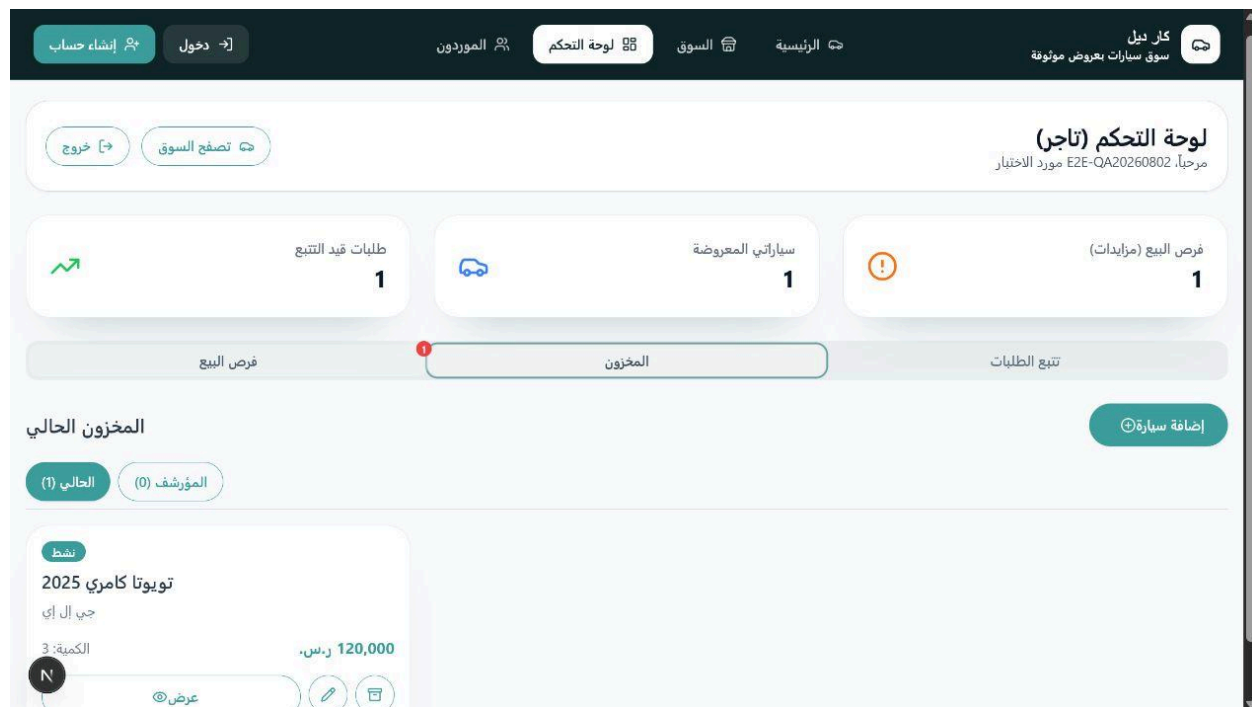

QA evidence completed:

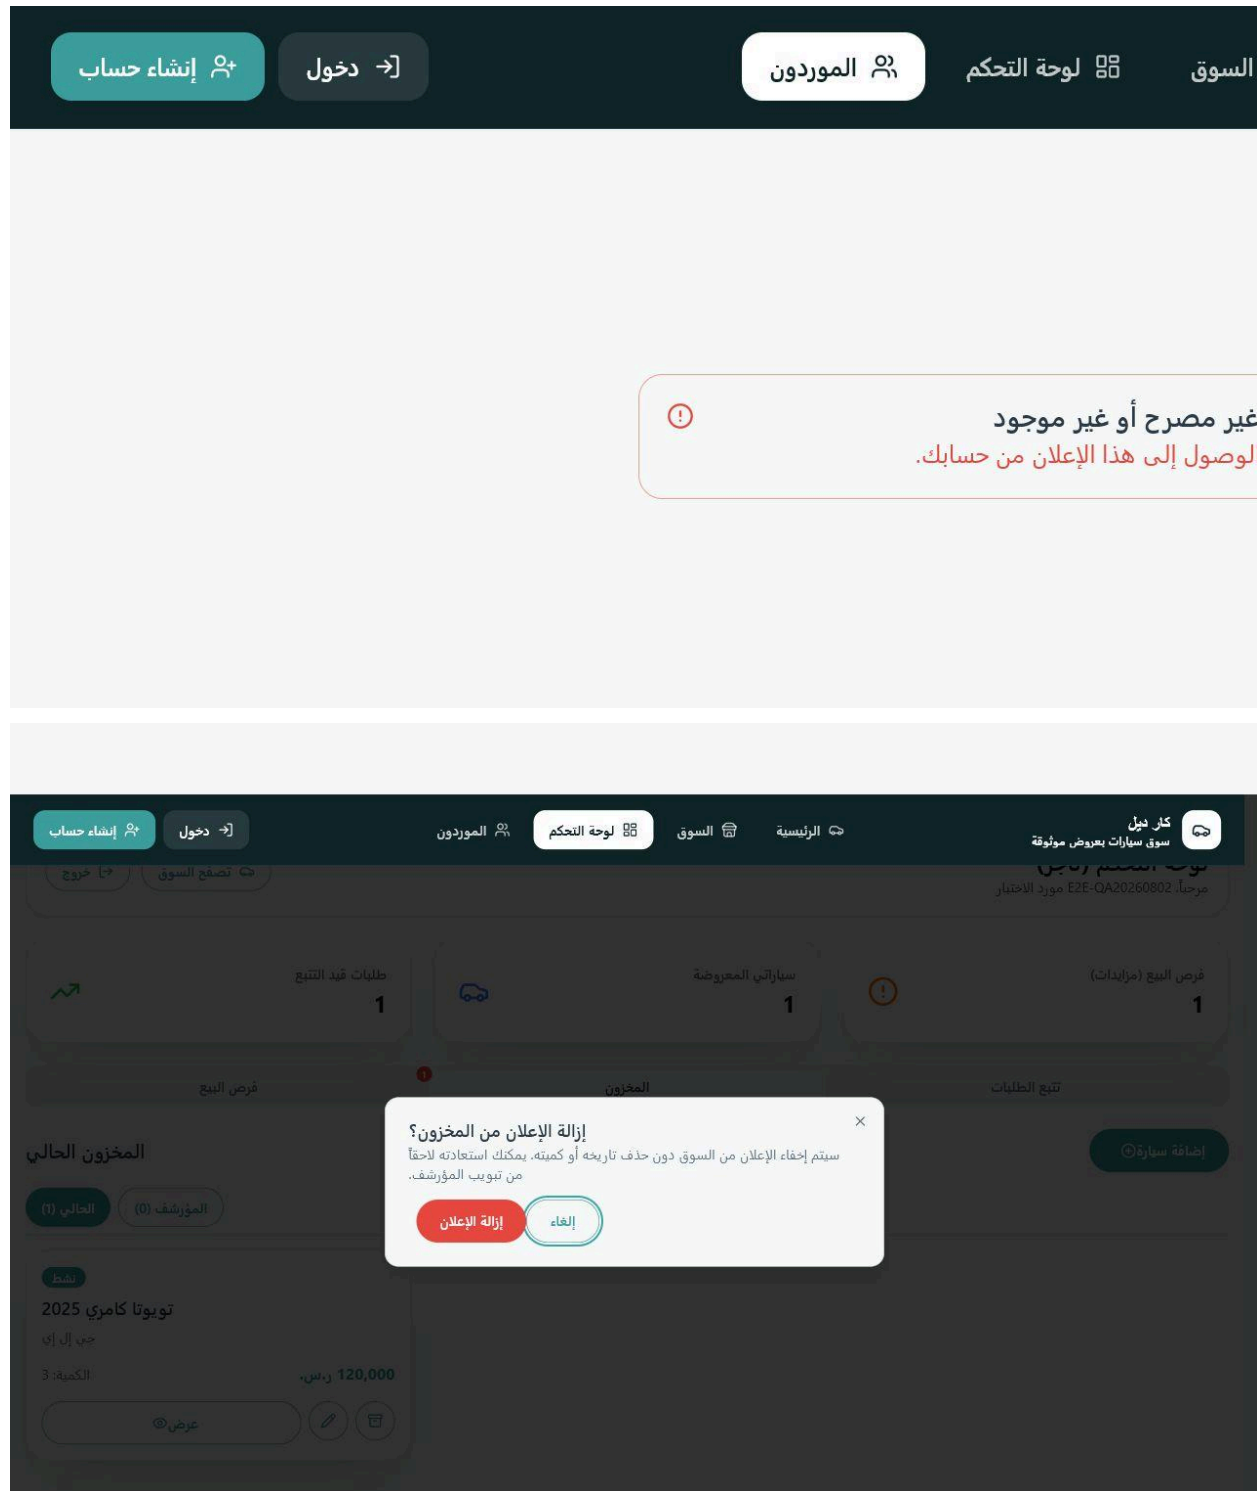

- Inventory card showed View, Edit, and Remove actions.
- Direct navigation by a second dealer to the first dealer's edit URL returned the Arabic not-authorized/not-found state without listing data.
- Remove confirmation explained that the listing is hidden, history and quantity are retained, and restoration is possible.

Not yet end-to-end verified:

- The remote database does not currently expose archive/restore/save RPCs, so actual create/edit/archive/restore commits and archive guards could not be executed against the target environment.

Screenshots: Inventory actions, unauthorized edit, and archive confirmation.

6. Buyer-facing price and availability compatibility — PASS for current legacy data; new RPC blocked

Implemented:

- Buyer results use active dealer inventory price and quantity when available.

- Hidden and out-of-stock inventory are excluded by the new search path.
- Legacy configuration MSRP/images remain a migration-window fallback.
- Buyer detail shows display price, available quantity, dealer count, and representative listing data.

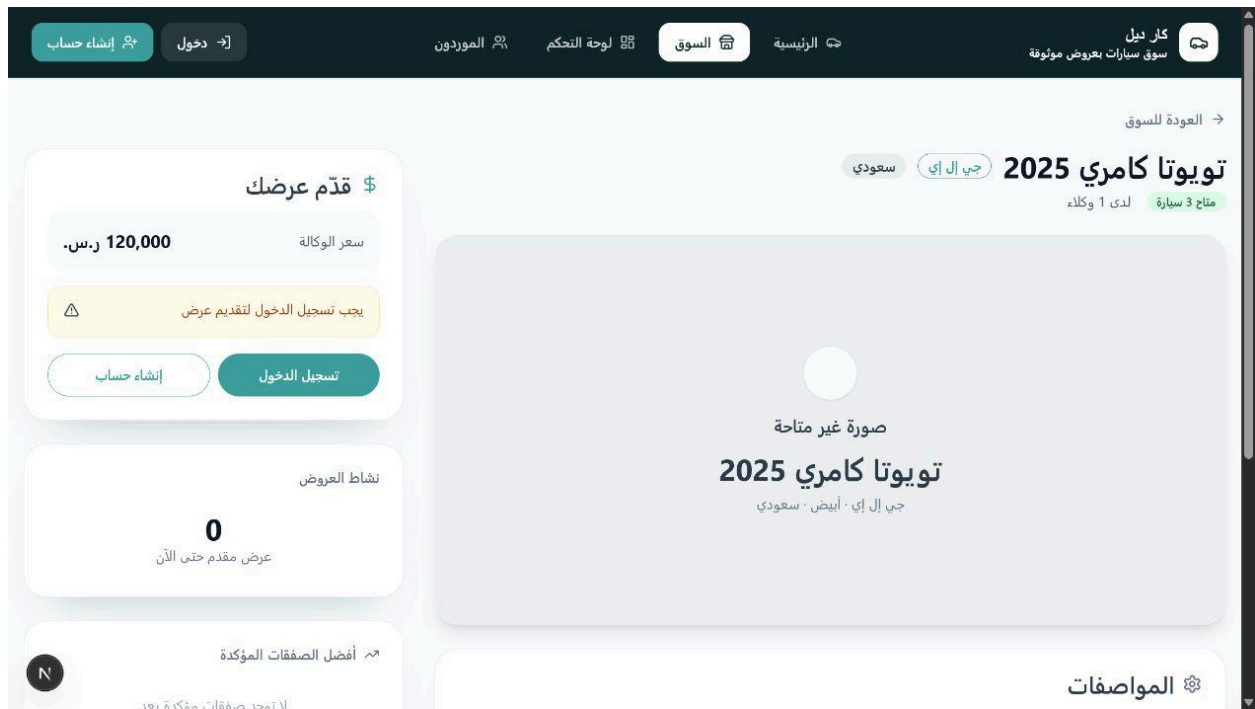

QA evidence completed:

- Buyer detail showed 120,000 SAR, 3 available, and 1 dealer for the seeded configuration.
- Marketplace search showed active car cards with prices and filters.
- The legacy fallback allowed these reads to work even though the new columns/RPC were not yet present remotely.

Not yet end-to-end verified:

- The buyer-safe search_available_configurations RPC is not yet present on the remote database, so its production path remains blocked.

Screenshots: Buyer detail and marketplace.

Release-gate results

- npm run build — PASS. Next.js production build and TypeScript checks completed successfully.
- npm run test:security — PASS. 9 tests passed, including dealer ownership, row locking, duplicate protection, shared-configuration safety, archive guards, restoration, and payment validation contracts.
- npm run lint — PASS with 0 errors and 7 pre-existing warnings in unrelated components/hooks.
- git diff --check — PASS with no whitespace errors.
- Local database lint — NOT AVAILABLE because the local Postgres service was not running.

Release blocker and required next step

The target remote Supabase database has not received the new migration. Read-only verification found that dealer_inventory.agency_price is absent and search_available_configurations is not available. Because of that, the application currently relies on its deliberate legacy read fallback for existing data, but the transactional save/archive/restore flows cannot be release-verified end to end.

Required deployment order:

1. Apply supabase/migrations/20260802120000_dealer_inventory_listing_fields.sql to the target database.
2. Confirm the backfill populated agency_price, listing_description, and listing_images.
3. Verify all four RPCs exist and are callable under the intended RLS roles.
4. Rerun create, edit, archive, restore, duplicate, archive-guard, and buyer-search tests against the migrated environment.
5. Run dealer and buyer smoke tests using seeded accounts.
6. Confirm existing listings retain price, images, quantity, and visibility.

QA conclusion

The client-facing UI changes requested in the feedback videos are implemented and visually verified in the local application. The compatibility fallback protects current legacy data while the migration is pending. The only material release blocker is database deployment: do not mark

the full remediation complete until the remote migration and lifecycle RPCs have been applied and the mutation flows have passed against that schema.

Temporary QA accounts and seeded records were removed after testing.
